Style's EPD-backed movable walls

Sustainability is now a defining priority in UK construction, with architects and specifiers expected to evidence environmental performance at every stage of design. In response, Style Group is proud to confirm that its full range of movable wall systems carries independently verified Environmental Product Declarations (EPDs), supporting transparent, data-led specification.

EPDs play a critical role in this landscape, offering independently assessed information based on Life Cycle Assessment (LCA). This methodology evaluates environmental impact from raw material extraction and manufacturing through to installation, operation and end-of-life, ensuring a comprehensive perspective. For architects and consultants, this level of transparency is essential. EPDs enable more accurate carbon reporting, support certification credits and reduce reliance on assumptions during the specification process. Just as importantly, they provide assurance that environmental claims are credible and independently verified.

By extending EPD certification across its entire movable wall range, Style Group goes beyond individual product innovation to deliver a cohesive, sustainability-focused offering. This approach not only simplifies specification but also aligns flexible space design with broader ESG strategies and client expectations. With sustainability now integral to project success, Style's commitment to EPD-backed solutions ensures specifiers can meet environmental targets without compromising on performance, aesthetics or functionality.
